

■ Novus ADOS — Block Layered Architecture Specification

Autonomous Defect & Orchestration System *End-to-End Enterprise Technology Stack & Layered Component Topology*

Executive Architectural Overview

The **Novus ADOS** architecture is engineered around a **Decoupled Blackboard Pattern** integrated with an event-driven **Decision Orchestrator**. The system separates low-level physical telemetry ingestion from higher-order cognitive reasoning, policy governance, and enterprise action execution across **6 distinct architectural layers**.

Detailed Block Layer Specifications

■ Layer 6: Executive Intel & Strategic Dashboard

The topmost layer provides strategic operational visibility to plant directors, VP of Manufacturing, and C-suite executives.

- **watsonx.ai Copilot:** Conversational AI assistant allowing natural language queries into active line health, root-cause confidence vectors, and historical resolution logs.
- **MTTR Analytics Engine:** Real-time MTTR compression metrics comparing human baseline (4.2 hrs) against ADOS automated loop (39 mins).
- **Protected Revenue Index:** Calculates dollars saved per shift by preventing downstream scrap and avoiding line stoppage penalties.
- **Plant Health Index:** Aggregates multi-line telemetry into a single availability percentage.

■ Layer 5: Governance Engine & Safety Locks

Enforces role-based authorization, risk boundaries, and executive safety locks before any action is executed.

- **Autonomy Tier Controller:** Evaluates risk exposure ($\$ \text{Exposure} \times \text{Confidence Score}$) to assign resolution tiers:
- **Tier 0 (Fully Autonomous):** Financial exposure $< \$500$ and Confidence $> 85\%$. Executes without human delay.
- **Tier 1 (Plant Manager Approval):** Financial exposure $\$500$ – $\$5,000$ or Confidence 60–85%. Routes to Plant Manager queue.
- **Tier 2 (Executive Safety Lockout):** Financial exposure $> \$5,000$ or critical safety boundary. Requires multi-executive sign-off.
- **Precedent Verdict Matcher:** Checks historical verdict agreements in Cloudant to validate policy consistency.
- **RBAC Session Manager:** Signs and verifies JWT session tokens across Operator, Engineer, Executive, and Auditor personas.

■ Layer 4: Decision Orchestrator & Enterprise Integrations

The central coordinator managing state machine transitions and executing system-of-record writes to enterprise applications.

- **State Machine Core** (`orchestrate/orchestrator.py`): Manages the incident lifecycle across 5 stages: Ingress ➡ ■ Diagnosis ➡ ■ CandidateGen ➡ ■ GovernanceHold ➡ ■ Execution.
- **watsonx Orchestrate ADK:** Native Python tool bindings (`ibm_watsonx_orchestrate.agent_builder.tools`) exposing ADOS capabilities directly to watsonx Orchestrate.

- **ServiceNow ITSM Connector:** Authenticated Table API integration (integrations/connectors/watsonx_itsm.py) creating live ServiceNow Incident (INC), Change Request (CHG), and Operator Notification records.
- **SAP ERP RFC Adapter:** Queries enterprise inventory for replacement spindle assemblies and places automated B2B logistics holds.

■ Layer 3: Decision Memory & Causal Recalibration

Stores persistent execution history and provides memory-augmented RAG context for cognitive reasoning.

- **IBM Cloudant NoSQL Database:** Stores persistent JSON documents across three databases: ados_incidents, ados_events, and ados_users.
- **Precedent Vector RAG Engine:** Computes cosine similarity across historical incident embeddings to surface prior successful mitigations.
- **Bayesian Causal Graph Engine:** Maintains weighted graph edges between symptoms (e.g. vibration, humidity) and root causes (e.g. bearing wear).
- **Feedback Recalibration Loop:** Adjusts causal graph weights dynamically upon incident resolution reinforcement.

■ Layer 2: Cognitive Specialist Agent Swarm (8 Agents)

Eight specialized L2 AI agents working via the decoupled Blackboard pattern:

```
graph LR
    subgraph Perception ["1. Perception Phase"]
        A1["Vision Spec Agent"]
        A2["CAD Comparison Agent"]
    end

    subgraph Diagnosis ["2. Diagnosis Phase"]
        A3["Causal Isolation Agent"]
    end

    subgraph CandidateGen ["3. Candidate Generation"]
        A4["Param Adjustment Agent (Option A)"]
        A5["Substitution Agent (Option B)"]
    end

    subgraph Evaluation ["4. Evaluation & Execution"]
        A6["Impact Sim Agent (Monte Carlo)"]
        A7["Re-routing Agent"]
        A8["Feedback & Calib Agent"]
    end
```

Perception --> Diagnosis --> CandidateGen --> Evaluation

- **Vision Spec Agent:** Inspects visual anomaly payloads and bounding boxes from camera sensors.
- **CAD Spec Agent:** Aligns measured dimensions against nominal STEP CAD vector models.

- **Causal Isolation Agent:** Traverses Bayesian causal edges + runs local LLM reasoning to isolate root cause.
- **Parameter Adjustment Agent:** Computes live PLC speed, feed rate, and coolant parameter compensations.
- **Substitution Agent:** Matches part specifications against SAP inventory and B2B supplier lead times.
- **Impact Simulation Agent:** Runs Monte Carlo simulations to calculate exact cost, downtime, and risk scores.
- **Re-routing Agent:** Determines target workstation rerouting and dispatch logistics.
- **Feedback Calibration Agent:** Captures human approval verdicts and updates Bayesian edge weights.

■ Layer 1: Event Bus & Payload Ingress

Low-latency telemetry ingestion hub validating schemas and broadcasting events.

- **FastAPI Ingress Hub:** REST/WebSocket gateway ingesting plant sensor telemetry streams.
- **Redis Pub/Sub Event Envelope:** High-throughput event channel serializing fault vectors across the swarm.
- **Pydantic v2 Validation Core:** Enforces strict JSON schema validation for all event payloads before agent consumption.
- **Microsecond Telemetry Stream:** Collects high-frequency spindle vibration, thermal, and acoustic logs.

Complete Technology Stack Matrix

| Architectural Layer | Core Technologies & Frameworks | Primary File / Module Path |

| :--- | :--- | :--- |

| **L6 :: Executive Intel** | Next.js 15, React 19, TailwindCSS, @remotion/media |
frontend-next/src/app/executive/ |

| **L5 :: Governance Engine** | Python 3.13, PyJWT, Pydantic v2, Policy DSL | orchestrate/governance.py |

| **L4 :: Decision Orchestrator** | watsonx Orchestrate ADK, ServiceNow API, SAP RFC |
orchestrate/orchestrator.py |

| **L3 :: Decision Memory** | IBM Cloudant NoSQL, NumPy Cosine RAG | knowledge/cloudant_client.py |

| **L2 :: Cognitive Swarm** | Local LLM (Qwen3 4B via Ollama), OpenCV, NumPy |
backend/app/routers/agents_registry.py |

| **L1 :: Event Bus Ingress** | FastAPI, Redis Pub/Sub, Uvicorn, Pydantic v2 | backend/app/main.py |

Audit Traceability: All state transitions from Layer 1 through Layer 6 are assigned a unique `trace\_id` and logged to Cloudant, enabling complete audit transparency for ISO 9001 compliance.
